

HALO CLOUDAPP

HEALTH

SAFETY

VAPE

The HALO Cloud App combines actionable intelligence and real-time notification of events with analytics such as heat maps and event trend graphs - all on your mobile device. Version 3.0 and above enables users with access rights to multiple sites to filter data and analytics by location. **The power of HALO Cloud now available at your fingertips.**

MOBILE PUSH AND EMAIL NOTIFICATIONS

Enable your staff to respond quickly to vaping, safety, security and environmental events thanks to real-time push notifications to their mobile devices. HALO Cloud enables email and push notifications to be configured for specific sites, devices, users, events and time windows as required.

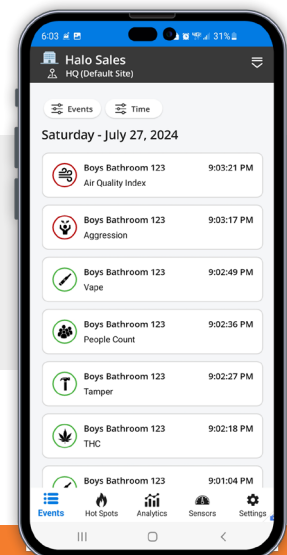

HOT SPOTS AND SENSOR DASHBOARDS

HALO Cloud App Dashboards provide staff with at-a-glance analytics to identify locations needing immediate attention and inform weekly resource planning. The Hot Spots screen identifies rooms generating the most events (such as vaping), over four time periods: today, week-to-date, last week and last 4 weeks. The Sensors screen enables staff such as facilities managers to ensure that the indoor environment is conducive to learning and working by tracking temperature, humidity, air quality, carbon dioxide, particulates, light and noise in real-time.

EVENTS

View details of all recent events: event type, date and time and device. The app enables users to filter events by site, event type and time window. Admins can also enable and disable events from specific devices for the entire team, as required.
